### What Drives the 180Ah Battery Price?

Ever wondered why two batteries with the same 180Ah rating can differ in price by hundreds of dollars? Let's peel back the layers. At Highjoule Technologies, we've seen commercial clients save up to \$12,000 annually by understanding these factors:

#### The Chemistry Equation

Lead-acid batteries might cost \$150-\$300 upfront, but lithium-ion's \$500-\$900 price tag tells half the story. Our field data shows lithium solutions last 3-5x longer in solar applications. Take the HL-180Li model - its cycle life exceeds 6,000 charges compared to 1,200 cycles in typical lead-acid units.

#### Capacity vs. Reality

Here's the kicker: actual usable capacity varies wildly. Most 180Ah batteries only deliver 80-90% in real-world conditions. But Highjoule's adaptive BMS systems maintain 95%+ efficiency through Texas summer heatwaves - a game-changer for solar farms battling temperature swings.

#### Lead-Acid vs. Lithium: A Cost Showdown

Let's break down a typical solar installation comparison:

Factor	Lead-Acid	Highjoule Lithium
--------	-----------	-------------------

Initial Cost	\$250	\$850
--------------	-------	-------

Lifespan	3 years	10+ years
----------	---------	-----------

Efficiency Loss	25%	
-----------------	-----	--
