What is active frequency support capability (AFSC) of PV stations? With the increasing penetration of photovoltaic (PV) in power grid, to cope with the deteriorating frequency security of the system, PV stations are required to participate in frequency regulation by grid codes. Knowing the active frequency support capability (AFSC) of PV stations is essential for strategy design of frequency response. What are the main functions of energy storage power station? Li et al. [8, 9] concluded that the main functions of the energy storage power station are peak load regulation, long-term power supply, primary frequency regulation, stabilizing power fluctuation, standby power and tracking planned power generation. Why are energy storage stations important? As the proportion of renewable energy infiltrating the power grid increases, suppressing its randomness and volatility, reducing its impact on the safe operation of the power grid, and improving the level of new energy consumption are increasingly important. For these purposes, energy storage stations (ESS) are receiving increasing attention. Why are centralized energy storage power stations important? With the innovation of battery technology, large-capacity centralized energy storage power stations continue to be used as power sources to provide energy support for the grid [5 - 7], which are included in the grid-connected operation and auxiliary service management. How to improve active power reserve capacity of PV stations? It recommends that to enhance the active power reserve capability of PV stations, it is necessary to improve power regulation factors of PV stations. In addition, frequency stability factors are positioned on the direct-impacting and intermediate-impacting levels (L1-L3). What is the power limit of energy storage power station? As for the whole energy storage power station, its power limit and power change rate are limited to the installed capacity, and the maximum limit of 1-min active power change is 10% of the installed capacity.
