How do compressed air storage systems use energy?The modeled compressed air storage systems use both electrical energy (to compress air and possibly to generate hydrogen) and heating energy provided by natural gas (only conventional CAES). We use three metrics to compare their energy use: heat rate, work ratio, and roundtrip exergy efficiency (storage efficiency). What is the exergy loss of compressed air by throttling?The exergy loss of compressed air by throttling is about 5%-8% in existing CAES systems . Although it is possible to increase the storage volume to reduce the operating pressure range, doing so results in low energy density and high construction costs. What is compressed air energy storage (CAES)?Compressed air energy storage (CAES) is a relatively mature technology with currently more attractive economics compared to other bulk energy storage systems capable of delivering tens of megawatts over several hours, such as pumped hydroelectric [1-3]. CAES stores electrical energy as the exergy of compressed air.
