Why do distribution system operators use energy storage systems? The distribution system operator (DSO) is eager to generate active electricity by using the maximum production of RESs as they also have low operational expenses. Furthermore, under the aforementioned circumstances, energy storage systems (ESS) or demand response programs (DRP) are used to enhance the network's technical and economic metrics. Can a hybrid energy system use a battery for energy storage? Numerous studies examined hybrid renewable energy systems (HRES) using the battery (Bt) for energy storage. According to [1], an optimal sizing of a PV-WT-Bt hybrid power system was proposed to be applied to the weather station in Troyes-Barberey, France. The system met the demand requirements with minimal total cost. Why is hp a good choice for energy management & system sizing? HP was integrated into the generation unit with PV to maximize power production in the system. In this study, HP systems demonstrated the highest efficiency in energy management and system sizing as they directly supplied energy to the consumer without requiring Bt storage.
