Can a battery pack thermal management system reduce condensation?This paper introduces an innovative battery pack thermal management system that combines air and liquid cooling with a return air feature to mitigate condensation in traditional models. Why is condensation a problem in a liquid cooling system?This leads to a significant increase in the heat exchange area required for liquid cooling systems and a continuous reduction in the supply water temperature, especially in high-humidity environments, potentially causing a serious issue: condensation. How to prevent condensation at the bottom of a cold plate?In this manner, the air, carrying residual heat and with a certain flow velocity, can effectively prevent condensation at the bottom of the cold plate. This approach not only suppresses condensation but also optimizes the thermal management efficiency. Fig. 13. Thermal management structure of the battery pack with return air structure. Does the return air structure reduce condensation area?Compared to the original liquid-cooled battery thermal management system, the proportion of the condensation area has significantly decreased by 39.68 %. This result clearly demonstrates the significant effectiveness of the return air structure in reducing the condensation area. Can hybrid air-cooled and liquid-cooled systems mitigate condensation in lithium-ion battery thermal management systems?This study introduces an innovative hybrid air-cooled and liquid-cooled system designed to mitigate condensation in lithium-ion battery thermal management systems (BTMS) operating in high-humidity environments. Does a hybrid cooling system reduce condensation area?The study results show that compared to traditional liquid cooling systems, the proposed hybrid system reduces the condensation area by approximately 39.68 % at a wind speed of 0.5 m/s, and the temperature difference decreases by 0.35 K.
