What are the challenges associated with the diffusion of photovoltaic (PV) based des?Garlet et al. studied the challenges associated with the diffusion of Photovoltaic (PV) based DESs in southern Brazil. They reported that despite having immense solar energy potential in southern Brazil, installed capacity is much lower due to the existence of technical, social, economic, and political barriers. What are the different types of energy storage policy?Approximately 16 states have adopted some form of energy storage policy, which broadly fall into the following categories: procurement targets, regulatory adaption, demonstration programs, financial incentives, and consumer protections. Below we give an overview of each of these energy storage policy categories. Do off-grid renewables-based Dess require energy storage systems?Off-grid renewables-based DESs require energy storage systems. Storage technologies however are still expensive and result in extra investment. A large number of DESs can also adversely affect the stability of the grid. Therefore, it is necessary to address the question related to the quality standards of the equipment and services in DES projects. What is a distributed energy system?Distributed energy systems are an integral part of the sustainable energy transition. DES avoid/minimize transmission and distribution setup, thus saving on cost and losses. DES can be typically classified into three categories: grid connectivity, application-level, and load type. Why do we need distributed energy systems?It particularly studied DES in terms of types, technological features, application domains, policy landscape, and the faced challenges and prospective solutions. Distributed energy systems are an integral part of the sustainable energy transition. DES avoid/minimize transmission and distribution setup, thus saving on cost and losses. What factors determine the optimal size and location of an energy storage system?In this regard, most research studies consider parameters such as energy storage efficiency, life cycle, reliability indices, network dynamics among other parameters to formulate the optimal size and location of an energy storage system.
