What is dynamic programming in energy storage system planning? To address the issues of limited Energy Storage System (ESS) locations and the flexibility unevenly distributed in the large-scale power grid planning, this paper introduces the Dynamic Programming (DP) theory into flexibility planning, and proposes a DP-based ESS siting and sizing method. How flexible is the energy storage system? To address these challenges, the future power system must have sufficient flexibility. The Energy Storage System (ESS) is an important flexible resource in the new generation of power systems, which offers an efficient means to address the high randomness, fluctuation, and uncertainty of grid power. What is energy storage allocation dynamic programming? By combining the state transition equation and the DP basic equation, the proposed method culminates in the energy storage allocation dynamic programming model, which determines the optimal locations, capacities, and rated powers of ESSs, along with the construction cost. What is energy storage allocation dynamic programming (ESA-DP)? The proposed Energy Storage Allocation Dynamic Programming (ESA-DP) model gives a certain degree of flexible ramping capability to each partitioning area, so that the flexibility is evenly distributed in the large-scale grid. Should centralized energy storage be used in large-scale grids? Deploying centralized ESS in large-scale grids inevitably involves the decisions of siting and sizing, both of which are crucial to ensure effective grid flexibility improvements.
