Cell Connection Systems (CCS) are integral components in energy storage solutions, specifically within battery packs. They are responsible for the safe and efficient connection of individual cells within a battery. Each cell in a battery pack has a specific role, and CCS ensures that these cells are properly connected. The CCS combines individual cells in a parallel and series configuration, providing both energy and power for the pack and critical sensor data to the Battery Management System (BMS). This information is used to monitor and control the charging and discharging of the battery, ensuring its safe and efficient operation.
