How do system integrators develop energy monitoring systems? With a flexible platform supporting diverse communication protocols, system integrators can quickly develop energy monitoring systems by seamlessly handling bottom-layer acquisition and upper-layer integration. The process includes: install ECU- in each of the six factories to collect data from devices via Ethernet and RS-485. Is Advantech ecu- a good choice for a small energy storage system? The Advantech ECU- is a suitable choice for smaller energy storage systems below 2MW with I/O requirements under 2,000 points. Equipped with rich communication I/O (2 CANbus 2 COM + 2 Ethernet) and a Cortex A9 processor, it serves as a robust IoT gateway. Why do I need an IoT gateway or edge controller? Due to diverse communication interfaces (Modbus, CANbus, DL/T645), an IoT gateway or edge controller is crucial. It needs high-density I/O points to handle large-scale BESS, converting multiple protocols into a standardized IoT format for data processing, upload, applications, and storage. How does ecu- work? ECU- met their needs for monitoring energy consumption of the whole operation processes (from empty bottle filling to adding cork stoppers, labeling, packing and shipping). Data from sensors and electric meters are collected through ECU- cloud enabled intelligent communication gateway.
