Do energy storage stations improve frequency stability?With the rapid expansion of new energy, there is an urgent need to enhance the frequency stability of the power system. The energy storage (ES) stations make it possible effectively. However, the frequency regulation (FR) demand distribution ignores the influence caused by various resources with different characteristics in traditional strategies. Is energy storage a new regulatory resource?As a new type of flexible regulatory resource with a bidirectional regulation function [3, 4], energy storage (ES) has attracted more attention in participation in automatic generation control (AGC). It also has become essential to the future frequency regulation auxiliary service market . Why is frequency regulation demand distribution important?However, the frequency regulation (FR) demand distribution ignores the influence caused by various resources with different characteristics in traditional strategies. Considering efficiency evaluation, an FR strategy is established to better utilize the advantages and complementarity of various ESs and traditional power units (TPUs). How can Fr Power optimization improve frequency stability?In order to improve the frequency stability, minimize FR control costs, and rationalize the revenue allocation between FR resources, a double-module FR power optimization strategy is proposed considering the cost, performance, and revenue of TPU and ES. The significant innovations of this paper can be described as follows: What is power distribution strategy based on comprehensive efficiency?(3) The power distribution strategy based on comprehensive efficiency provides a more reasonable power and compensation revenue distribution scheme for ES units, increasing the net FR benefits of the ES station and enhancing the FR performance of the grid. It stimulates the ES unit to improve its efficiency and actively participate in FR response. A regional grid with a TPU and a hybrid ES station is used to validate the effectiveness of the proposed strategy. The results show that the FR resources are stimulated to improve their performance, and thus, the frequency performance of the system is improved by the proposed strategy.
