What is Lift Energy Storage Technology (LEST)? Lift Energy Storage Technology (LEST) is a gravitational-based storage solution. It stores energy by lifting wet sand containers or other high-density materials using autonomous trailer devices. The system requires empty spaces on the top and bottom of the building. Can lifts be used as energy storage devices? There are several ghost towns where the lifts could be used as energy storage devices through Lift Energy Storage Technology (LEST). A review of ghost cities in China can be seen in Ref. . In some cases, the investors do not rent empty apartments because they want to be flexible to sell the flat any time they get a good price. What is the proposed arrangement for the lift energy storage system? An example of the proposed arrangement is presented in Table 1. Energy is stored as potential energy by elevating storage containers with an existing lift in the building from the lower storage site to the upper storage site. Electricity is then generated by lowering the storage containers from the upper to the lower storage site. Could lift energy storage technology be a viable alternative to long-term energy storage? Conclusion Lift Energy Storage Technology (LEST) could be a viable alternative to long-term energy storage in high-rise buildings. LEST could be designed to store energy for long-term time scales (a week) to generate a small but constant amount of energy for a long time. Can lifts and empty apartments store energy? This paper proposes using lifts and empty apartments in tall buildings to store energy, providing an affordable solution for the variable nature of renewable energy sources like wind and solar power. Where can LEST be used as energy storage devices? LEST is particularly interesting in China ghost towns. There are several ghost towns where the lifts could be used as energy storage devices. A review of ghost cities in China can be seen in Ref. . Fig. 9 b is a world map with the number of buildings higher than 250 m in a city.
