Can energy storage equipment improve the economic and environment of residential energy systems? It is concluded that this kind of energy storage equipment can enhance the economics and environment of residential energy systems. The thermal energy storage system (TESS) has the shortest payback period (7.84 years), and the CO₂ emissions are the lowest. Why is energy storage important in the application of residential energy storage? In the application of residential energy storage, the profit return from the promotion of energy storage is an important factor affecting the motivation of users to install energy storage. Should energy storage systems be model studies? They should be treated as model studies that can be replicated by the user for their own purposes. Additionally, they are a clear cross-section of highly relevant, contemporary use cases for energy storage systems that exemplify how valuable the flexibility they offer can be. Can a composite energy system be used for residential energy storage? Currently, the application and optimization of residential energy storage have focused mostly on batteries, with little consideration given to other forms of energy storage. Based on the load characteristics of users, this paper proposes a composite energy system that applies solar, electric, thermal and other types of energy. Can energy storage devices complement the HEMS residential energy management strategy? In this study, to complement the HEMS residential energy management strategy, we introduce storage devices based on existing target home energy systems. Adding energy storage devices can improve the performance of the PVs and thermal electric pumps in the system, stabilize the system, enhance user economics, and balance grid loads.
