How are hybrid energy storage systems based on different technologies? To compare hybrid energy storage systems based on very different technologies, usually with opposite application purposes in terms of the power management and the storage timeframe as the main features, a proper sizing procedure was defined. Indeed, flywheel and rSOC are very different technologies. What is the power management strategy for flywheel-battery HESS? The power management strategy (PMS) implemented for flywheel-battery HESS was based on the SPSA algorithm. This algorithm presents great advantages, such as ease of implementation, robustness and online operating conditions. In this paper, the SPSA implementation follows the procedure already presented and detailed in [1]. How much does a HESS battery/flywheel cost? The system with PV and HESS battery+flywheel follows from 0.160 EUR/kWh, and the system with PV and HESS rSOC+battery from 0.270 EUR/kWh. The parity between the solution with and without energy storage is reached at 0.180 EUR/kWh and 0.450 EUR/kWh, for the HESS battery+flywheel and HESS rSOC+battery respectively. Why do we need a hydrogen storage system? The main concern is that such technologies have characteristics suitable for specific purposes. For example, hydrogen guarantees long-term storage but low round-trip efficiency. How much residual grid dependence can a hybrid energy storage system achieve? Table 6. Annual energy balances. From the data in Table 6, it is clear to notice that the utmost performance of any hybrid energy storage system installed in the given MG allows reaching a residual grid dependence of 48%. Can hybrid energy storage systems be designed for a mini-grid? This paper shows a case study where hybrid energy storage systems are designed for an existing mini-grid equipped with a PV plant.
