How long does a grid need to store electricity? First, our results suggest to industry and grid planners that the cost-effective duration for storage is closely tied to the grid's generation mix. Solar-dominant grids tend to need 6-to-8-h storage while wind-dominant grids have a greater need for 10-to-20-h storage. Does energy storage reduce power grid costs? In terms of energy storage, several studies have demonstrated its importance in enhancing renewable power utilization and reducing power grid costs (Yu et al., 2022b). developed a power expansion model aimed at minimizing total transition costs, incorporating energy storage technology. Why are storage systems not widely used in electricity networks? In general, they have not been widely used in electricity networks because their cost is considerably high and their profit margin is low. However, climate concerns, carbon reduction effects, increase in renewable energy use, and energy security put pressure on adopting the storage concepts and facilities as complementary to renewables. Is energy storage the future of power systems? It is imperative to acknowledge the pivotal role of energy storage in shaping the future of power systems. Energy storage technologies have gained significant traction owing to their potential to enhance flexibility, reliability, and efficiency within the power sector. Should energy storage be integrated into power system models? Integrating energy storage within power system models offers the potential to enhance operational cost-effectiveness, scheduling efficiency, environmental outcomes, and the integration of renewable energy sources. What are the benefits of energy storage systems? The deployment of energy storage systems (ESS) can also create new business opportunities, support economic growth, and enhance the competitiveness of the power market. There are several ESS used at a grid or local level such as pumped hydroelectric storage (PHES), passive thermal storage, and battery units [, ,].
