First-generation flywheel energy-storage systems use a large steel flywheel rotating on mechanical bearings. Newer systems use carbon-fiber composite rotors that have a higher tensile strength than steel and can store much more energy for the same mass. Flywheel energy storage (FES) works by accelerating a rotor to a very high speed and maintaining the energy in the system as . When energy is extracted from the system, the flywheel's rotational Flywheels are not as adversely affected by temperature changes, can operate at a much wider temperature range, and are not subject to many of the common failures of chemical . They are also less potentially damaging to the environment, being o Beacon Power Applies for DOE Grants to Fund up to 50% of Two 20 MW Energy Storage Plants, Sep. 1, o Sheahen, Homemade Flywheel Energy Storage Motor: A Step-by-Step With rising interest in renewable energy storage, DIYers are now experimenting with flywheel systems.
