

how to judge leakage of energy storage components

How does battery leakage affect system performance? During actual usage, the battery leakage problem leads to the degradation of the system performance, which may cause arcing, external short circuit or even thermal runaway. Therefore, it is essential to analyze the internal mechanism of electrolyte leakage phenomenon and design the corresponding fault diagnosis algorithm. How does a leaking battery affect ohmic resistance? The EIS curve of the leaking battery in Fig. 5 (b) shows a shift to the right, which means the value of the intersection with Z' has been increasing. This also indicates that the ohmic resistance of the battery is increasing as the leakage failure occurs, as shown in the model fitting results in Table 3. What is the resistance of a battery with electrolyte leakage? It can be seen that the battery resistance of first 14 cycles with electrolyte leakage is distributed in the normal range, while the 15th and 16th cycle resistance are obvious outliers. How does a leaking battery affect the voltage drop? It is also found that the voltage drop of the leaking battery is significantly larger during the battery relaxation process, which is also verified by the self-discharge rate test results completed at 20 % SOC. The test showed that the self-discharge rate was about 0.3 mV/day for normal battery and 1.7 mV/day for leaky battery. Does disassembled leaking battery module have higher voltage difference slope? This work tests the disassembled leaking battery module of the practical vehicle. The incremental capacity analysis of the charging process indicated that the battery had capacity loss, and the voltage signal trend analysis of the discharging process found that the leaking battery had higher voltage difference slope. What happens if a battery is leaking after 2 h? The measured battery shell voltage after 2 h of resting is shown in Table 1. It shows the "negative-shell" voltage of the leaking battery is significantly reduced, indicating that there may be loss or denaturation of the internal anode material.
