Can seasonal energy storage decarbonize the energy system? However, only a few technologies are capable of offsetting the long-term (seasonal) mismatch between renewable generation and energy demand. Here we outline the role and potential of seasonal energy storage to decarbonize the energy system. Are seasonal energy storage technologies limiting commercial deployment? This paper reviews selected seasonal energy storage technologies, outlines potential use cases for electric utilities, identifies the technical challenges that could limit successful commercial deployment, describes developer initiatives to address those challenges, and includes estimated timelines to reach commercial deployment. Can seasonal energy storage be economically viable? To accommodate the use of this variable energy throughout the year the grid may benefit from economically viable seasonal energy storage to shift energy from one season to another. Storage of this nature is expected to have output durations from 500 to hours or more. Why is seasonal energy storage important? These low-carbon energy sources also tend to abate during the fall and winter months. To accommodate the use of this variable energy throughout the year the grid may benefit from economically viable seasonal energy storage to shift energy from one season to another. Why is energy storage important? Energy storage is required to reliably and sustainably integrate renewable energy into the energy system. Diverse storage technology options are necessary to deal with the variability of energy generation and demand at different time scales, ranging from mere seconds to seasonal shifts. What is a seasonal target for energy storage? Seasonal targets for energy storage can serve as boundaries for planning energy storage based on a weekly or daily scale. In this case, the run-off difference and daily fluctuations of intermittent renewable power are used to coordinate storage capabilities of hydropower systems in different rivers. Tanks are the most suitable solutions for seasonal storage, as they can be implemented regardless of location for volumes up to 100,000 m³. However, pits are the most optimal solutions in terms of cost and size, as they can be constructed for volumes up to 200,000 m³.
