Can a liquid CO₂ energy storage system reduce heat transfer loss?5. Conclusions A novel liquid CO₂energy storage-based combined cooling, heating and power system was proposed in this study to resolve the large heat-transfer loss and system cost associated with indirect refrigeration and low cooling capacity without phase change for direct refrigeration. Can liquid co₂energy storage be used as a combined cooling system?Therefore, this study proposes a novel combined cooling, heating, and power system based on liquid CO₂energy storage. Using direct refrigeration with a phase change, the system has a large cooling capacity and can achieve a wide range of cooling-to-power ratios through the mass flow regulation of the refrigeration branch. What is a liquid air energy storage system?When air is stored in liquid form, it develops into a liquid-air energy storage (LAES) system. The density of liquid air is higher than that of gaseous air, and thus the required vessel volume is smaller, making the LAES system less restricted by geographical conditions and increasing its energy storage density , . Why is liquid CO₂ energy storage better than CAES?The main reason is that liquid CO₂energy storage systems in standalone electricity storage systems have lower round-trip efficiency and higher ESD than CAES systems , which also affects the performance of CCHP systems. Are energy storage systems more efficient than standalone systems?Abstract Energy storage systems combining cooling, heating, and power have higher flexibility and overall energy efficiency than standalone systems. Can energy storage systems be coupled with CCHP systems?The coupling of energy storage systems with combined cooling, heating, and power (CCHP) systems is a key research direction. Table 1summarizes the power-generation, heating, and cooling methods of CCHP systems based on energy storage systems. Table 1.
