What is liquid air energy storage? This technology is called Liquid Air Energy Storage (LAES). At off-peak times, energy produced by renewable sources is fed to an air liquefaction unit, while, when electrical energy is needed, the liquid air (LA) could be pumped, heated and expanded into turbines to generate power (Brett and Barnett, ).

### 2.1.1. History of liquid air energy storage plant

The use of liquid air or nitrogen as an energy storage medium can be dated back to the nineteenth century, but the use of such storage method for peak-shaving of power grid was first proposed by University of Newcastle upon Tyne in .

### How does a refrigeration cycle work?

As well as generating cold energy for pre-cooling compressed air to increase liquid air production, a refrigeration cycle can be used to cool compressed air at the compressors' inlets to reduce the amount of specific power required.

### What is energy storage density?

For an energy storage technology, the stored energy per unit can usually be assessed by gravimetric or volumetric energy density. The volumetric energy storage density, which is widely used for LAES, is defined as the total power output or stored exergy divided by the required volume of storage parts (i.e., liquid air tank).

### When was liquid air first used for energy storage?

The use of liquid air or nitrogen as an energy storage medium can be dated back to the nineteenth century, but the use of such storage method for peak-shaving of power grid was first proposed by University of Newcastle upon Tyne in . This led to subsequent research by Mitsubishi Heavy Industries and Hitachi .

### Can a standalone LAEs recover cold energy from liquid air evaporation?

Their study examined a novel standalone LAES (using a packed-bed TES) that recovers cold energy from liquid air evaporation and stored compression energy in a diathermic hot thermal storage. The study found that RTE between 50-60% was achievable.

### 4.3. Integration of LAES

It is then liquefied and stored at low pressure in an insulated cryogenic tank. To recover the stored energy, a highly energy-efficient pump compresses the liquid air to . It is based on storing liquid cryogenic fluids after their liquefaction from an initially gaseous state. A particular form of CES, Liquid Air Energy Storage (LAES), has gained growing attention respect to other cryogenics. The current state of LAES is still at the development and demonstration stages since no commercial Liquid-cooled energy storage power stations are advanced facilities designed to store energy in a liquid medium, often utilizing specialized systems to manage heat, optimize efficiency, and ensure reliability.
