Therefore, a 4-hour device has an expected capacity factor of 16.7% ( $4/24 = 0.167$ ), and a 2-hour device has an expected capacity factor of 8.3% ( $2/24 = 0.083$ ). Degradation is a function of the usage rate of the model, and systems might need to be replaced at some point during the analysis period. The ATB represents cost and performance for battery storage with durations of 2, 4, 6, 8, and 10 hours. It represents lithium-ion batteries (LIBs)--primarily those with nickel manganese cobalt (NMC) and lithium iron phosphate (LFP) chemistries--only at this time, with LFP becoming the primary. The domination of lithium-ion batteries in energy storage may soon be challenged by a group of novel technologies aimed at storing energy for very long hours. BloombergNEF's inaugural Long-Duration Energy Storage Cost Survey shows that while most of these technologies are still early stage and This report is a continuation of the Storage Futures Study and explores the factors driving the transition from recent storage deployments with four or fewer hours to deployments of storage with greater than four hours. The report specifically builds on the first publication in the Storage Futures Advancing energy storage: The future trajectory of lithium-ion By bridging the gap between academic research and real-world implementation, this review underscores the critical role of lithium-ion batteries in achieving decarbonization, Why 2-Hour Energy Storage Is the Game-Changer Your Power So there you have it--the 2-hour energy storage revolution, no PhD required.
