What is the future of mobile energy storage? Increasing Interest in Electric Vehicles (EVs): The market for mobile energy storage is expected to grow as a result of the growing popularity of electric vehicles and the need for mobile energy storage solutions for fleet electrification, EV charging infrastructure, and on-the-go energy storage. What are energy storage technologies? Informing the viable application of electricity storage technologies, including batteries and pumped hydro storage, with the latest data and analysis on costs and performance. Energy storage technologies, store energy either as electricity or heat/cold, so it can be used at a later time. What are the different types of mobile energy storage technologies? Demand and types of mobile energy storage technologies (A) Global primary energy consumption including traditional biomass, coal, oil, gas, nuclear, hydropower, wind, solar, biofuels, and other renewables in (data from Our World in Data 2). (B) Monthly duration of average wind and solar energy in the U.K. from to . Are battery electricity storage systems a good investment? This study shows that battery electricity storage systems offer enormous deployment and cost-reduction potential. By , total installed costs could fall between 50% and 60% (and battery cell costs by even more), driven by optimisation of manufacturing facilities, combined with better combinations and reduced use of materials. Are battery storage costs based on long-term planning models? Battery storage costs have evolved rapidly over the past several years, necessitating an update to storage cost projections used in long-term planning models and other activities. This work documents the development of these projections, which are based on recent publications of storage costs. The projections show a wide range of storage costs, both in terms of current costs as well as future costs. In the near term, some projections show increasing costs while others show substantial declines, with cost reductions by of -3% to 36%. The projections show a wide range of storage costs, both in terms of current costs as well as future costs. In the near term, some projections show increasing costs while others show substantial declines, with cost reductions by of -3% to 36%. Figure ES-2 shows the overall capital cost for a 4-hour battery system based on those projections, with storage costs of \$245/kWh, \$326/kWh, and \$403/kWh in and \$159/kWh, \$226/kWh, and \$348/kWh in .
