What is the implementation plan for the development of new energy storage? In January, the National Development and Reform Commission and the National Energy Administration jointly issued the Implementation Plan for the Development of New Energy Storage during the 14th Five-Year Plan Period, emphasizing the fundamental role of new energy storage technologies in a new power system. What is the future of energy storage? Storage enables electricity systems to remain in balance despite variations in wind and solar availability, allowing for cost-effective deep decarbonization while maintaining reliability. The Future of Energy Storage report is an essential analysis of this key component in decarbonizing our energy infrastructure and combating climate change. How do new energy vehicles affect charging infrastructure? The popularity of new energy vehicles puts forward higher requirements for charging infrastructure. As an important supply station for new energy vehicles, public charging, and swapping stations have new energy access, energy storage configuration, and topology that directly affect charging efficiency, grid stability, and economy. Why are energy storage technologies important? They are also strategically important for international competition. KPMG China and the Electric Transportation & Energy Storage Association of the China Electricity Council ('CEC') released the New Energy Storage Technologies Empower Energy Transition report at the China International Energy Storage Conference. Why is energy storage configuration important? Energy storage configuration is an important part of new energy access system of public charging and swapping stations. 6, 7 Due to the intermittency and instability of new energy power generation, direct access to power grid may affect its stable operation. Therefore, it is imperative to configure an appropriate energy storage system. Are independent energy storage stations a good investment? This does not augur well for the market in terms of long-term competition. There will be safety risks associated with excessive cost control and an indifference to quality. Independent energy storage stations enjoy good long-term prospects, though this segment is sluggish in the short term. Future energy infrastructure, energy platform and energy storage The energy platform is made of three key components: the energy cloud for the generation, distribution and storage of electricity, the digital platform for industry and customers.
