Are thermal energy storage systems insulated? Conclusions Today, thermal energy storage systems are typically insulated using conventional materials such as mineral wools due to their reliability, ease of installation, and low cost. The main drawback of these materials is their relatively high thermal conductivity, which results in a large insulation thickness. What is thermal insulation? Thermal insulation is an aspect in the optimization of thermal energy storage (TES) systems integrated inside buildings. Properties, characteristics, and reference costs are presented for insulation materials suitable for TES up to 90 °C. Why do small-scale storage systems need thermal insulation? The economic hurdle of small-scale systems highlights the importance of developing cost-effective thermal insulation solutions that allow the storage structure to be built of low-cost materials and, more importantly, to reduce the space required by large storage systems incorporated inside buildings.

3. Thermal insulation methods and materials

Should thermal insulation be applied on the outside wall of a storage? Whenever possible, applying thermal insulation on the outside wall of the storage is usually the simplest and most cost-effective option. One of the main advantages of this arrangement is that the thermal insulation is neither subject to the pressure of the storage, nor directly exposed to the hot water reservoir. Which insulating materials are used in thermal conductivity measurement?

2. Methodology

2.1. Thermal conductivity measurement of different insulating materials

Expanded polystyrene (EPS), mineral wool and polyurethane foam (PU) represent the most common materials that are used in TES, while Vacuum Insulation Panels and Aerogel Based Products are innovative Super Insulating Materials (SIMs). Are advanced insulation materials a promising insulation technology for storage tanks? Therefore, advanced insulation materials are a promising insulation technology for the storage tanks. The Super Insulating Materials (SIMs), such as Vacuum Insulation Panels (VIPs) and Aerogel Based Products (ABPs), have a 5 - 10 times lower thermal conductivity compared to the traditional insulating materials.
