However, increasingly, microgrids are being based on energy storage systems combined with renewable energy sources (solar, wind, small hydro), usually backed up by a fossil fuel-powered generator. The goal of the DOE Energy Storage Program is to develop advanced energy storage technologies, systems and power conversion systems in collaboration with industry, academia, and government institutions that will increase the reliability, performance, and sustainability of electricity generation and battery ESS, two thermal storages, and gas storage are incorporated. In the MEMG, multiple energy forms, that is, electricity, heat/cooling power, and gas are coupled together. Excess electricity can convert to gas by the power to gas (P2G) equipment and heating power by the power to thermal (P2T). By incorporating renewable energy sources, energy storage systems, and advanced control systems, microgrids help to reduce dependence on fossil fuels and promote the use of clean and sustainable energy sources.
