This technology strategy assessment on sodium batteries, released as part of the Long-Duration Storage Shot, contains the findings from the Storage Innovations (SI) strategic initiative. The objective of SI is to develop specific and quantifiable research, development, and deployment. China, which already boasts the world's largest energy-storage capacity, is set to nearly double that level by 2030, with an anticipated investment of 250 billion yuan (US\$35 billion), according to Beijing's latest action plan. As outlined in the action plan, China's "new-energy storage system" analysis on energy storage systems utilising significant resources and diligent research have been dedicated to the investigation and enhancement of energy storage devices utilising hydrogen, lithium, or sodium. Alkaline-based aqueous sodium-ion batteries for large-scale energy storage show promise for large-scale energy storage, yet face challenges due to water decomposition, limiting their energy density and lifespan. Recent progress and prospects on sodium-ion batteries show promise for large-scale energy storage, yet face challenges due to water decomposition, limiting their energy density and lifespan. Moreover, all-solid-state sodium batteries (ASSBs), which have higher energy density, simpler structure, and higher stability and safety, are also under rapid development. Thus, SIBs and ASSBs are both expected to play a significant role in the future of energy storage.
