The sodium-ion battery (NIB or SIB) is a type of rechargeable battery, similar with lithium-ion battery. But using sodium ions (Na^+) as the charge carriers. Below picture shows a schematic diagram of a sodium-ion battery. The structure of sodium-ion batteries is similar to that of lithium-ion. A Sodium-Ion (Na-Ion) Battery System is an energy storage system based on electrochemical charge/discharge reactions that occur between a positive electrode (cathode) composed of sodium-containing layered materials, and a negative electrode (anode) that is typically made of hard carbons or Sodium-ion batteries are devices that store energy by converting electrical and chemical energy into each other. The fundamental working principle is very similar to that of lithium-ion batteries, based on the reversible shuttling of ions between two electrodes with the help of the electrolyte. A A sodium-ion battery is a type of rechargeable battery that utilizes sodium ions (Na^+) as the primary charge carriers. These batteries share a similar operating principle with lithium-ion batteries but use sodium, which is more plentiful and less expensive than lithium.
