

What are environmental pump stations used for? Environmental pump stations may serve a variety of purposes. Stations may be used to divert fresh water to control salinity in coastal estuaries or convey sediment laded waters for targeted deposition. These stations have also been designed to help restore fish habitat in river backwater systems. a. Does EM -2- apply to pumping station design? Although EM -2- was written for lock and dam operating equipment, many parts of the manual directly apply to pumping station design. This includes mechanical components such as couplings, gears, and bearings and also hydraulic systems. What is a pumped storage plant? Pumped storage plants are used to pump water from lower storage pools to upper storage pools usually during off peak times for use in hydropower generation at a later time. Design heads are typically larger than those of a typical stormwater or sanitary sewage station, and pump efficiency is generally a higher priority on these applications. How to isolate a pump station electrical system? d. Fused disconnect switches on the substation primary and an unfused disconnect switch inside the pump station structure on the substation secondary are provided to isolate the pump station electrical systems. Who maintains a pumping station? Most pumping stations are operated and maintained by local interests. The local levee or sewer district may not have the experience or expertise to maintain the PLC system. An evaluation should be made of the availability of qualified repair services and the competency level of the anticipated operating and maintenance personnel. (2) Environment.
