What is a control loop strategy? One loop focuses on preserving the synchronism of the generator to its own area. The second loop focuses on preserving the synchronism of a given area to the other areas. Each control loop strategy is based upon local and center-of-inertia frequency measurements. The strategy is derived from two perspectives. How to control the stored energy in a converter arm? Several procedures for controlling the total stored energy in each converter arm exist. A new approach is described in this paper. It is based on estimation of the stored energy in the arms by combining the converter electromotive force reference, the measured alternating output current, and the known direct voltage. Does the control strategy improve transient stability of power systems? Both perspectives result in the same strategy. The performance of the control strategy is evaluated on a four-machine power system model and on a 34-generator reduced-order model of the western North-American grid. The results show that this control approach significantly improves the transient stability of power systems.

Open-Loop Control of Modular Multilevel Converters Using Abstract: The internal control of a modular multilevel converter aims to equalize and stabilize the submodule capacitor voltages independent of the loading conditions.

Dynamic analysis of energy storage integrated systems This study primarily focuses on small signal stability of grid-following ESs, involving two well-known control loops: DC voltage control and active power control.

Energy-guarded Loop-control Architecture The use case presented here shows the energy-guarded loop-control architecture preserving the passivity - and also the stability - of a robotic system operating under detrimental conditions,

Analysis of Internal Energy in GFL-MMCs and a Decoupled gy-related control functions (i.e. dc voltage control, active power control). The proposed control scheme can be applied in MMC-based converters, such as STATCOM, HVDC, etc.

Time Based on the above problems, this section designs a three-dimensional energy control architecture suitable for MMC and introduces the process of energy control in terms of both a **Multi-Loop Transient Stability Control via Power Modulation**
