How does Green gravity energy storage work? Green Gravity's energy storage system moves heavy weights vertically in legacy mine shafts to capture and release the gravitational potential energy of the weights. By simply using proven mechanical parts and disused mine shafts, Green Gravity's energy storage technology is low-cost, long life and environmentally compelling. Can gravity energy storage be used to redevelop abandoned mine shafts? This paper has investigated gravity energy storage using suspended weights as a new technology for redeveloping abandoned deep mine shafts. It has been shown how to size of the suspended weight to maximize the energy storage capacity for a mine shaft, given its physical dimensions. How many coal mine shafts can be converted into gravity storage units? Using data from the United Kingdom Government Coal Authority Abandoned Mine Catalogue, it has been estimated there are 340 mine shafts that could be converted into gravity storage units with energy capacities above 1 MWh, providing 0.804 GWh of energy storage. How many mine shafts have a potential energy storage capacity? The maximum recorded depth for any of the shafts is m and the maximum recorded diameter is 7.55 m. Fig. 5. The number of mine shafts (for which depth and diameter information is available) with potential energy storage capacities above different levels. 340 mine shafts have a potential energy storage capacity above 1 MWh. Fig. 6. How do energy storage systems perform energy arbitrage? Storage systems can perform energy arbitrage by selling energy when wholesale energy prices are high, and buying energy when prices are low . Energy storage systems in distribution networks can also offer localized services, such as voltage regulation and peak-shaving .
