How does a battery energy storage system prevent overdischarge? Injected active power of both battery energy storage systems (BESSs) in case III. This protective measure prevents overdischarge, preserving the battery's operational integrity and longevity. It is worth noting that this lower limit depends on the battery technology, and hence, can be easily adjusted in the proposed control scheme. Can battery energy storage systems improve microgrid performance? This work was supported by Princess Sumaya University for Technology (Grant (10 9-)). The successful integration of battery energy storage systems (BESSs) is crucial for enhancing the resilience and performance of microgrids (MGs) and power systems. How much power does an inverter use? Here, both inverters are set to an active power reference of 30 kW and a reactive power reference of 5 kVAR. Note that the initial battery charge levels are set to 80% for the first and 50% for the second battery to allow evaluation of the inverter's capability to disconnect a battery as it approaches its lower SoC limit. How to generate a UC power reference? In order to generate the UC power reference, a digital low-pass filter whose bandwidth is adjusted according to the UC SOC is proposed. This allows a better usage of the UC available energy, while reducing frequent activation of controller protections and avoiding the calculation of the filter cut-off frequency for a certain driving cycle. How do mg inverters work? Notably, it excels in adapting to rapid load changes, maintaining active power at the specified reference while dynamically adjusting reactive power for voltage stability, which is ideal for MGs with dynamic load profiles. The inverters' reference output voltages (V_{ref}) are determined using a power flow analysis on the system. What is inverter disconnection? Inverter disconnection occurs when the SoC falls below its lower limit at 35%. Additionally, to maintain system power balance and stability, the nominal output power remains constant at the nominal capacity when the SoC exceeds 85%.
