Compressed-air-energy storage (CAES) is a way to store energy for later use using compressed air. At a utility scale, energy generated during periods of low demand can be released during peak load periods. The first utility-scale CAES project was in the Huntorf power plant in Elsfleth, Germany, and is still operational as of 2023. The Huntorf plant was initially developed by the German company Energy Storage Solutions. The working principle of REMORA utilizes LP technology to compress air at a constant temperature, store energy in a reservoir installed on the seabed, and store high-pressure air in underwater gas-storage tanks. Electrical Energy Storage (EES) refers to a process of converting electrical energy from a power network into a form that can be stored for converting back to electrical energy when needed [1-3]. Such a process enables electricity to be produced at times of either low demand, low generation cost or high demand. The performance of compressed air energy storage systems is centred round the efficiency of the compressors and expanders. It is also important to determine the losses in the system as energy transfer occurs on these components. There are several compression and expansion stages: from the charging stage to the storage stage, and from the storage stage to the expansion stage. What is the principle of air energy storage power station? 1. The principle of air energy storage power stations entails the utilization of compressed air for energy storage and retrieval, integral for addressing energy demand fluctuations, achieving grid stability, and implementing renewable energy storage. CAES offers a powerful means to store excess electricity by using it to compress air, which can be released and expanded through a turbine to generate electricity when the grid requires additional power. First proposed in the mid-20th century, CAES technology has gained renewed attention in the 21st century. Unlike the operational characteristics of traditional underground spaces, the underground lined rock caverns storing compressed air not only have to withstand alternating high internal pressures but also have to maintain a constant temperature.
